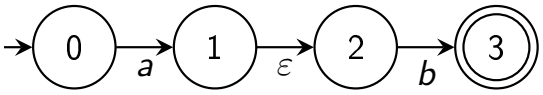
Construction d'un AFD à partir d'un AFN

Enoncé

Donner l'automate fini déterministe (AFD) de certaines des expressions régulières de l'exercice précédent.

1. ab
2. b*
3. a|b
4. ab*|c
5. ((a|b)|cc)*
6. b*a*|(cb)*
7. abc
8. (a|b)|c
9. a|(b|c)

Avec les AFD des expressions régulières (a|b)|c et a|(b|c), que peut-on en déduire sur la règle | ?

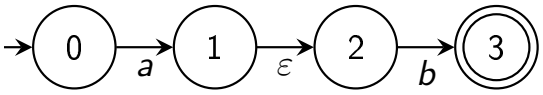


expr = ab

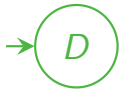
On rappelle que pour créer un AFD à partir d'un AFN, il faut créer des ε-fermetures d'ensemble d'états, en commençant par l'état de départ (ici l'état 0).

$$EpsilonFermeture(\{0\}) = \{0\}$$

En effet, l'ε-fermeture comprend tous les états de l'ensemble (ici uniquement 0) et comprend également tous les états qui peuvent être atteint avec une ε-transition, il n'y en a aucune ici.



expr = ab



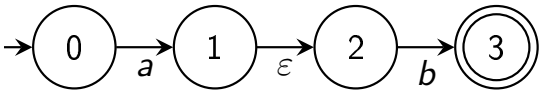
On rappelle que pour créer un AFD à partir d'un AFN, il faut créer des ε-fermetures d'ensemble d'états, en commençant par l'état de départ (ici l'état 0).

$$EpsilonFermeture(\{0\}) = \{0\}$$

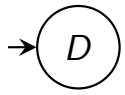
En effet, l'ε-fermeture comprend tous les états de l'ensemble (ici uniquement 0) et comprend également tous les états qui peuvent être atteint avec une ε-transition, il n'y en a aucune ici.

Voici donc D, notre nouvel état de départ, on l'ajoute à notre AFD :

$$D = \{0\}$$



expr = ab



On rappelle que pour créer un AFD à partir d'un AFN, il faut créer des ε-fermetures d'ensemble d'états, en commençant par l'état de départ (ici l'état 0).

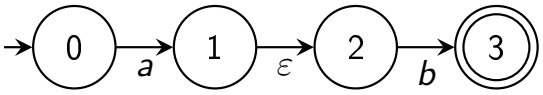
$$EpsilonFermeture(\{0\}) = \{0\}$$

En effet, l'ε-fermeture comprend tous les états de l'ensemble (ici uniquement 0) et comprend également tous les états qui peuvent être atteint avec une ε-transition, il n'y en a aucune ici.

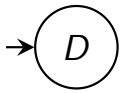
Voici donc D, notre nouvel état de départ, on l'ajoute à notre AFD :

$$D = \{0\}$$

On part maintenant de D, pour créer notre AFD.

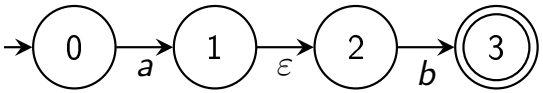


expr = ab

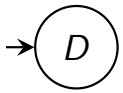


$D = \{0\}$

Etat actuel : $D = \{0\}$.

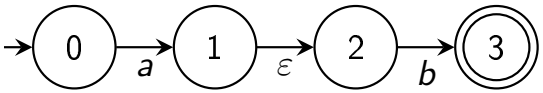


expr = ab

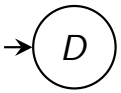


$D = \{0\}$

Etat actuel : $D = \{0\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis D.



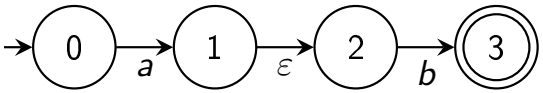
expr = ab



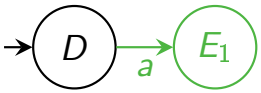
$D = \{0\}$

Etat actuel : $D = \{0\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis D.
Pour x = a, la seule transition de l'AFN est 0a1. On calcul donc l'ε-fermeture de 1.

$$EpsilonFermeture(\{1\}) = E_1 = \{1, 2\}$$



expr = ab

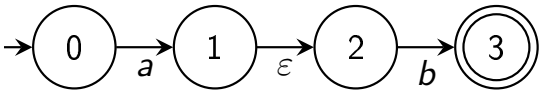


$D = \{0\}$
$E_1 = \{1, 2\}$

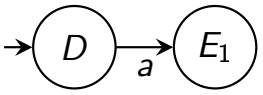
Etat actuel : $D = \{0\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis D.
Pour x = a, la seule transition de l'AFN est 0a1. On calcul donc l'ε-fermeture de 1.

$$EpsilonFermeture(\{1\}) = E_1 = \{1, 2\}$$

On ajoute ensuite l'état E_1 et la transition DaE_1 dans notre AFD.



expr = ab

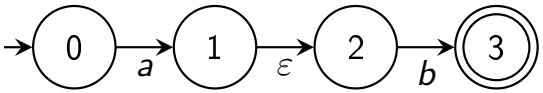


$D = \{0\}$
$E_1 = \{1, 2\}$

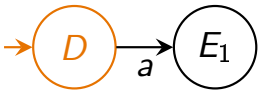
Etat actuel : $D = \{0\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis D.
Pour x = a, la seule transition de l'AFN est 0a1. On calcul donc l'ε-fermeture de 1.

$$EpsilonFermeture(\{1\}) = E_1 = \{1, 2\}$$

On ajoute ensuite l'état E_1 et la transition DaE_1 dans notre AFD.
Pour x = b, il n'y a aucune transition depuis l'état 0.



expr = ab

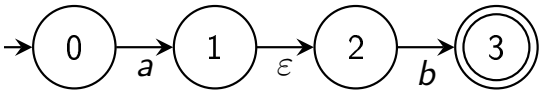


$D = \{0\}$
$E_1 = \{1, 2\}$

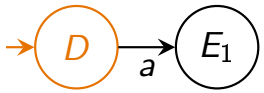
Etat actuel : $D = \{0\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis D.
Pour x = a, la seule transition de l'AFN est 0a1. On calcul donc l'ε-fermeture de 1.

$$EpsilonFermeture(\{1\}) = E_1 = \{1, 2\}$$

On ajoute ensuite l'état E_1 et la transition DaE_1 dans notre AFD.
Pour x = b, il n'y a aucune transition depuis l'état 0.
On marque maintenant D et on regarde s'il reste des états non marqués, c'est le cas donc on continue.

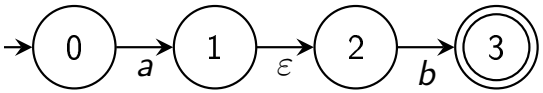


expr = ab

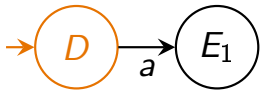


$D = \{0\}$
$E_1 = \{1, 2\}$

Etat actuel : $E_1 = \{1, 2\}$.

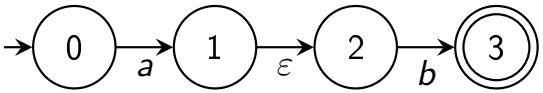


expr = ab

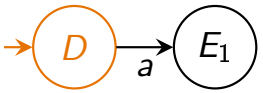


$D = \{0\}$
$E_1 = \{1, 2\}$

Etat actuel : $E_1 = \{1, 2\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis E_1.

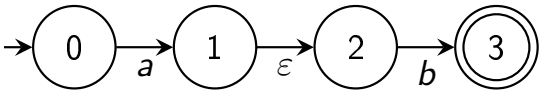


expr = ab

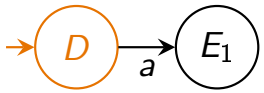


$D = \{0\}$
$E_1 = \{1, 2\}$

Etat actuel : $E_1 = \{1, 2\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis E_1.
Pour x = a, il n'y a aucune transition.



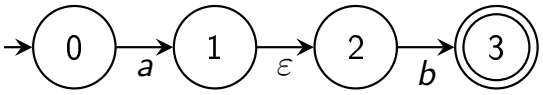
expr = ab



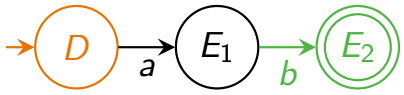
$D = \{0\}$
$E_1 = \{1, 2\}$

Etat actuel : $E_1 = \{1, 2\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis E_1.
Pour x = a, il n'y a aucune transition.
Pour x = b, il y a la transition 2b3, on calcule donc l'ε-fermeture de 3.

$$EpsilonFermeture(\{3\}) = E_2 = \{3\}$$



expr = ab

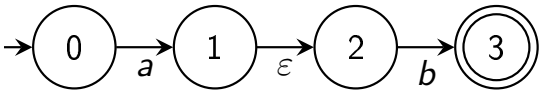


$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

Etat actuel : $E_1 = \{1, 2\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis E_1.
Pour x = a, il n'y a aucune transition.
Pour x = b, il y a la transition 2b3, on calcule donc l'ε-fermeture de 3.

$$EpsilonFermeture(\{3\}) = E_2 = \{3\}$$

On ajoute ensuite l'état E_2 et la transition $E_1 b E_2$ dans notre AFD. Comme $3 \in E_2$ et que 3 est un état final de l'AFN alors E_2 est également final.



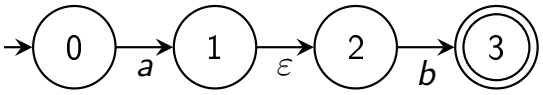
expr = ab

$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

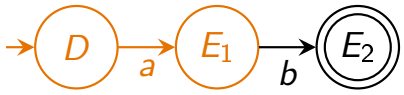
Etat actuel : $E_1 = \{1, 2\}$.
On va parcourir tout l'alphabet de notre vocabulaire et regarder les transitions depuis E_1.
Pour x = a, il n'y a aucune transition.
Pour x = b, il y a la transition 2b3, on calcule donc l'ε-fermeture de 3.

$$EpsilonFermeture(\{3\}) = E_2 = \{3\}$$

On ajoute ensuite l'état E_2 et la transition $E_1 b E_2$ dans notre AFD. Comme $3 \in E_2$ et que 3 est un état final de l'AFN alors E_2 est également final.
On marque maintenant E_1 et on regarde s'il reste des états non marqués, c'est le cas donc on continue.

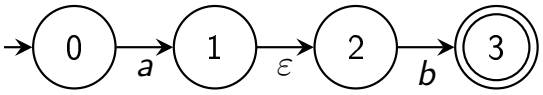


expr = ab



$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

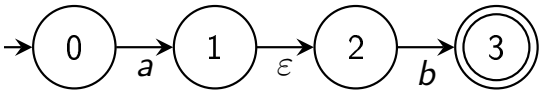
Etat actuel : $E_2 = \{3\}$.



expr = ab

$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

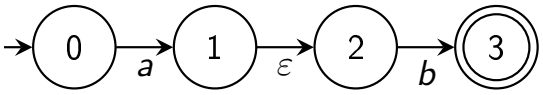
Etat actuel : $E_2 = \{3\}$.
Il n'y a aucune transition depuis l'état 3 donc on marque directement l'état E_2.



expr = ab

$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

Etat actuel : $E_2 = \{3\}$.
Il n'y a aucune transition depuis l'état 3 donc on marque directement l'état E_2.
Tous les états sont maintenant marqués, l'AFD est terminé.

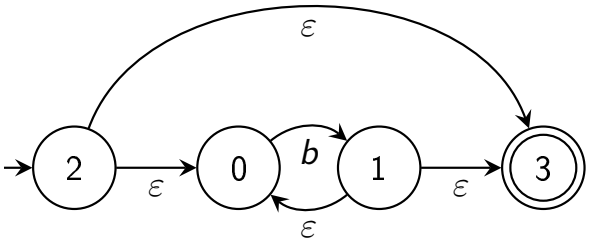


expr = ab

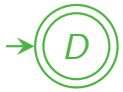
$D = \{0\}$
$E_1 = \{1, 2\}$
$E_2 = \{3\}$

Etat actuel : $E_2 = \{3\}$.
Il n'y a aucune transition depuis l'état 3 donc on marque directement l'état E_2.

Notez que la correction a été expliquée pour cet exemple mais ne le sera pas pour les prochains.



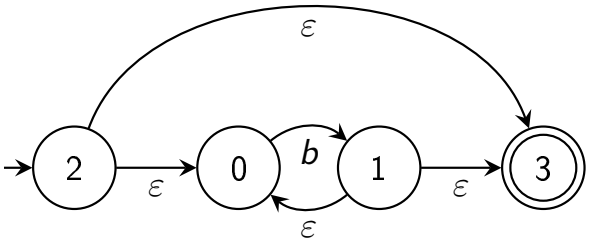
expr = b*



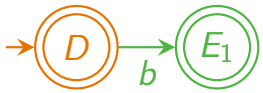
$D = \{0, 2, 3\}$

Calcul de l'état de départ :

$$D = EpsilonFermeture(\{2\}) = \{0, 2, 3\}$$



expr = b*

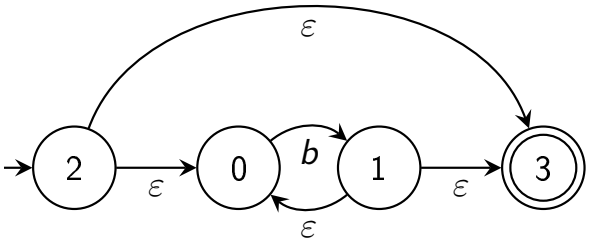


$D = \{0, 2, 3\}$

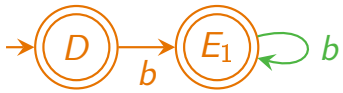
$E_1 = \{0, 1, 3\}$

Etat actuel : D

- x = b
- transitions : 0b1
- $EpsilonFermeture(\{1\}) = \{0, 1, 3\} = E_1$
- etat final : oui



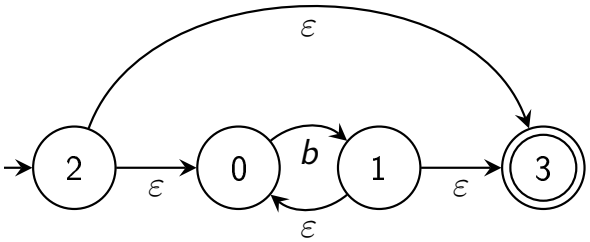
expr = b*



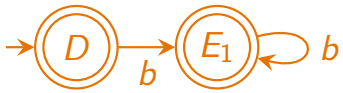
$D = \{0, 2, 3\}$
$E_1 = \{0, 1, 3\}$

Etat actuel : E_1

- x = b
- transitions : 0b1
- $EpsilonFermeture(\{1\}) = \{0, 1, 3\} = E_1$
- etat final : oui



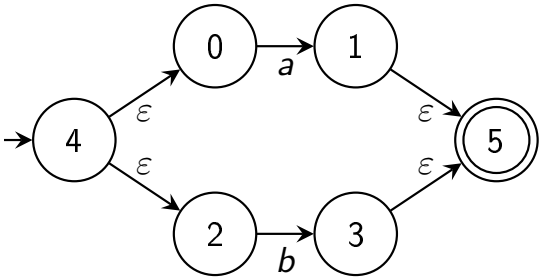
expr = b*



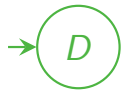
$D = \{0, 2, 3\}$

$E_1 = \{0, 1, 3\}$

AFD terminé, nombre d'états : 2



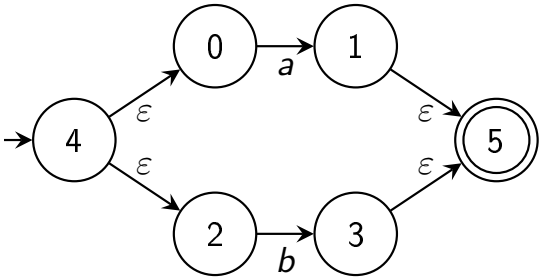
expr = a|b



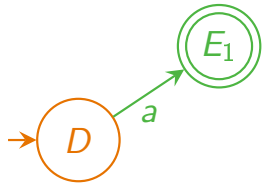
$D = \{0, 2, 4\}$

Calcul de l'état de départ :

$$D = EpsilonFermeture(\{4\}) = \{0, 2, 4\}$$



expr = a|b

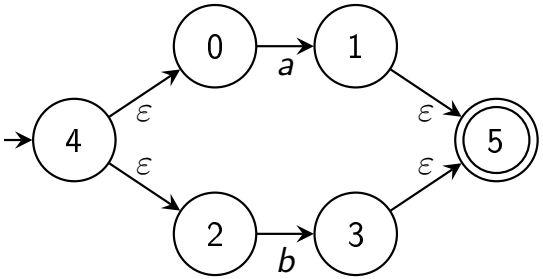


$D = \{0, 2, 4\}$

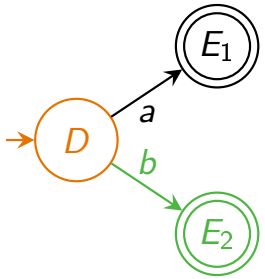
$E_1 = \{1, 5\}$

Etat actuel : D

- x = a
- transitions : 0a1
- $EpsilonFermeture(\{1\}) = \{1, 5\} = E_1$
- etat final : oui



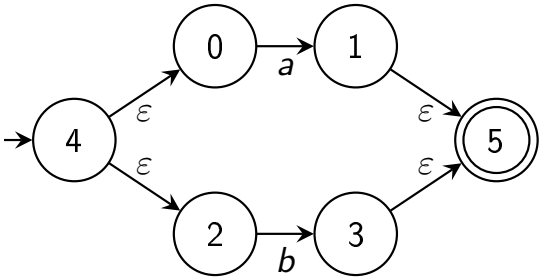
expr = a|b



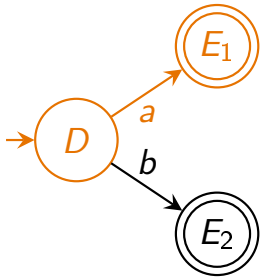
$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

Etat actuel : D

- x = b
- transitions : 2b3
- $EpsilonFermeture(\{3\}) = \{3, 5\} = E_2$
- etat final : oui



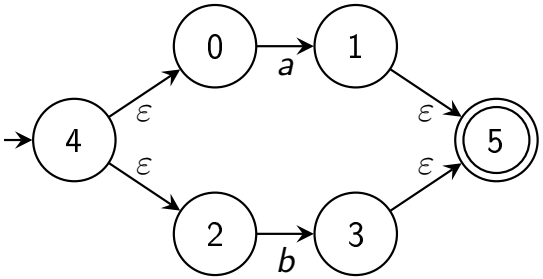
expr = a|b



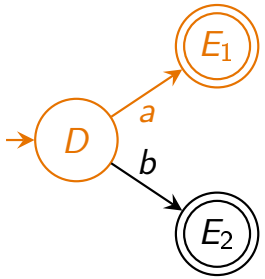
$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

Etat actuel : E_1

- x = a
- transitions : aucune



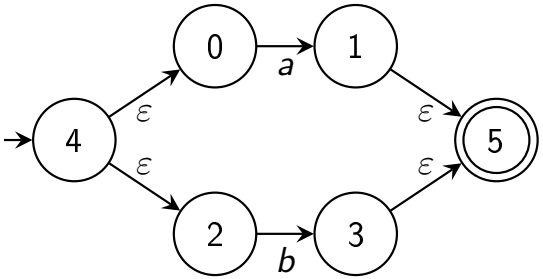
expr = a|b



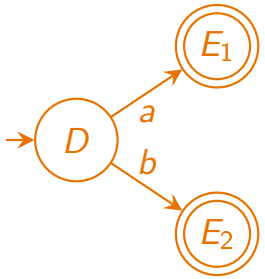
$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

Etat actuel : E_1

- x = b
- transitions : aucune



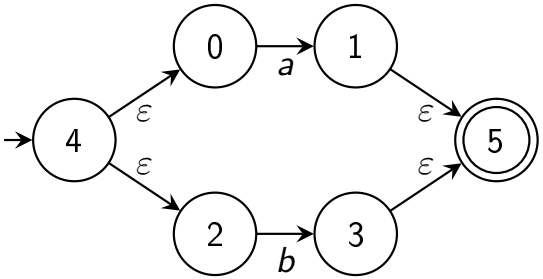
expr = a|b



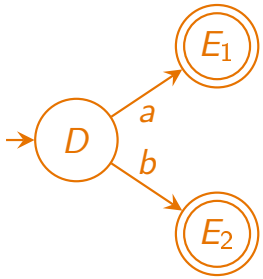
$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

Etat actuel : E_2

- x = a
- transitions : aucune



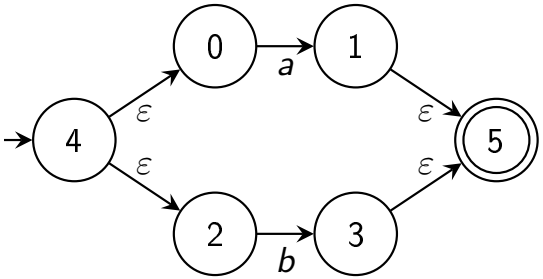
expr = a|b



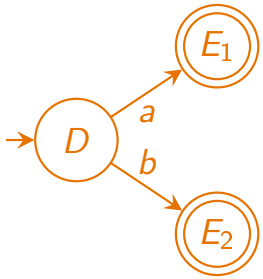
$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

Etat actuel : E_2

- x = b
- transitions : aucune

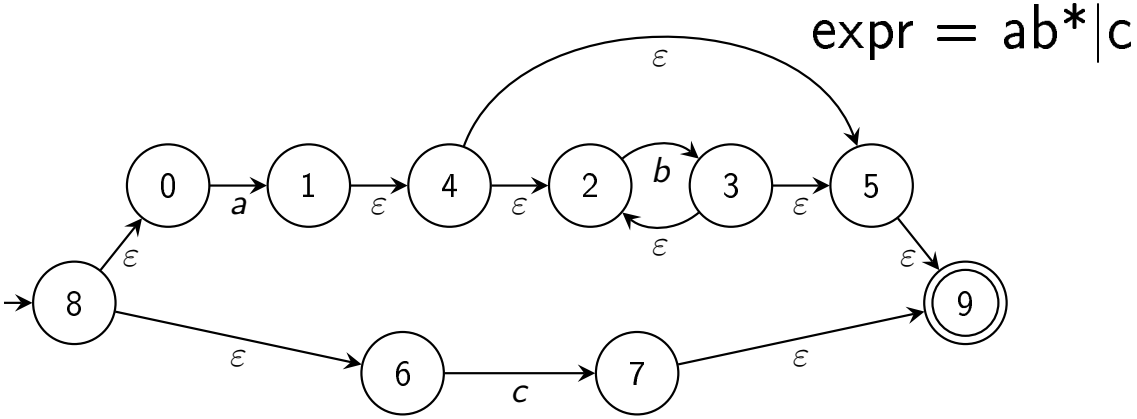


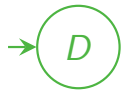
expr = a|b



$D = \{0, 2, 4\}$
$E_1 = \{1, 5\}$
$E_2 = \{3, 5\}$

AFD terminé, nombre d'états : 3

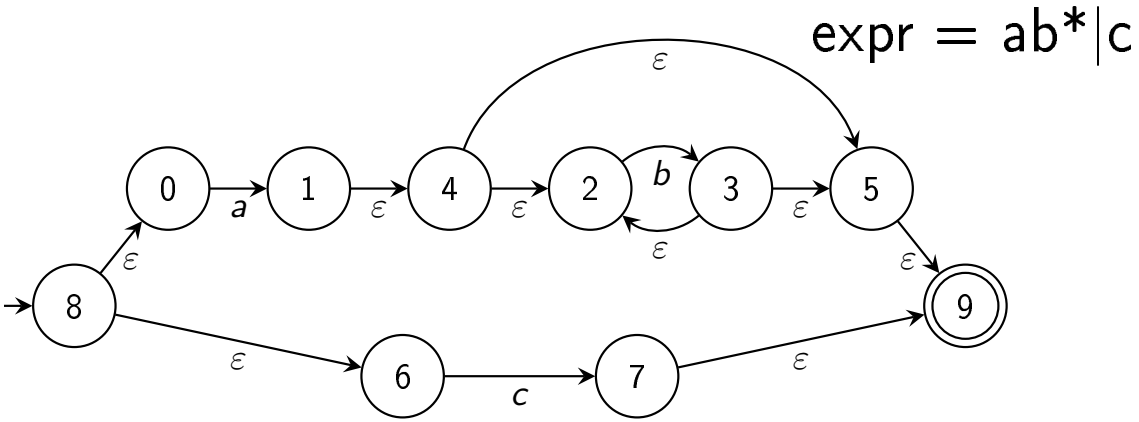


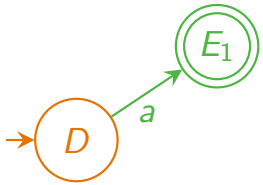


$D = \{0, 6, 8\}$

Calcul de l'état de départ :

$$D = EpsilonFermeture(\{8\}) = \{0, 6, 8\}$$



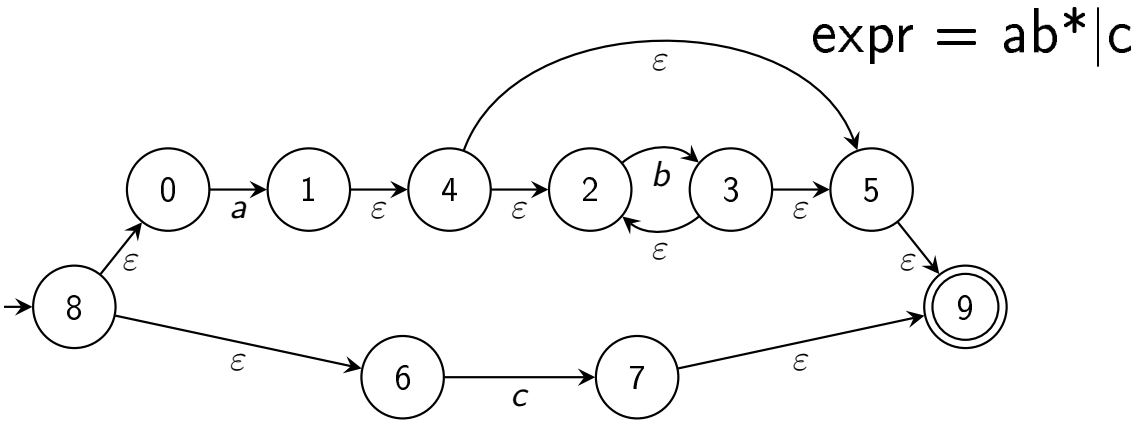


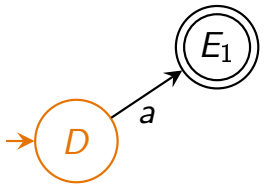
$D = \{0, 6, 8\}$

$E_1 = \{1, 2, 4, 5, 9\}$

Etat actuel : D

- x = a
- transitions : 0a1
- $EpsilonFermeture(\{1\}) = \{1, 2, 4, 5, 9\} = E_1$
- etat final : oui

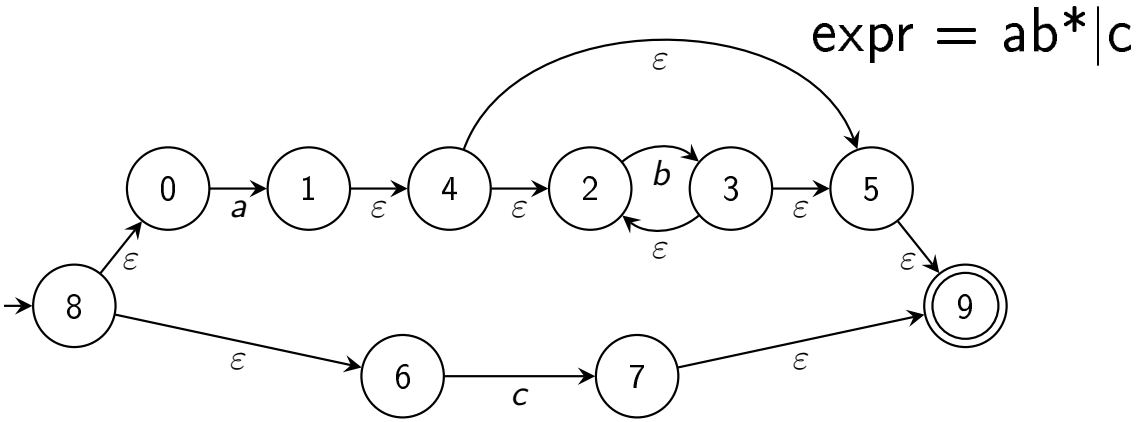


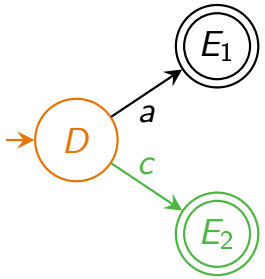


$D = \{0, 6, 8\}$
$E_1 = \{1, 2, 4, 5, 9\}$

Etat actuel : D

- x = b
- transitions : aucune





$D = \{0, 6, 8\}$

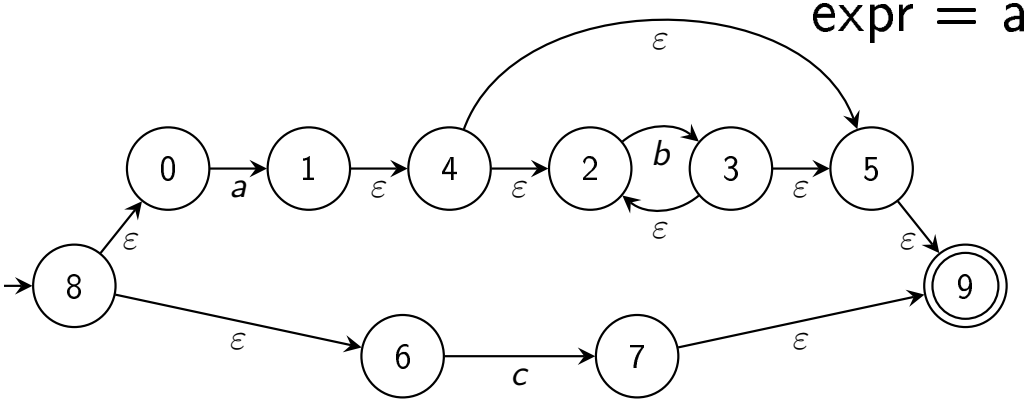
$E_1 = \{1, 2, 4, 5, 9\}$

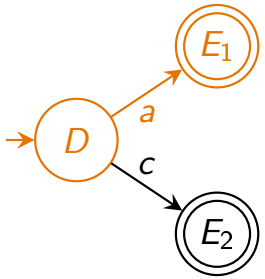
$E_2 = \{7, 9\}$

Etat actuel : D

- x = c
- transitions : 6c7
- $EpsilonFermeture(\{7\}) = \{7, 9\} = E_2$
- etat final : oui

expr = ab*|c





$D = \{0, 6, 8\}$
$E_1 = \{1, 2, 4, 5, 9\}$
$E_2 = \{7, 9\}$

Etat actuel : E_1

- x = a
- transitions : aucune

Les AFD des expressions régulières (a|b)|c et a|(b|c) sont strictement identiques. Cela montre que quels que soient a, b et c, la règle | est associative. Il est donc possible de supprimer les parenthèses sans ambiguité.

$$(a|b)|c = a|(b|c) = a|b|c$$
